

PHASE 6 – PROJECT TESTING PHASE

Date :	27.09.2026
Team ID :	SWTID-2026-4107
Project Name :	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Project Testing

The project testing phase is carried out to verify that the **Standard Laptop Procurement Automation** workflow functions correctly in the ServiceNow environment. The testing focuses on the complete process from submitting a Standard Laptop request through the Service Catalog to the automatic creation and assignment of the Catalog Task using Flow Designer.

The configured components are verified individually where required, followed by verification of the complete workflow.

1. Standard Laptop Request Submission

The testing begins by submitting a **Standard Laptop** request through the ServiceNow Service Catalog.

The Standard Laptop Catalog Item is selected and the required request information is entered before submitting the request. The system is checked to verify that the request is submitted successfully and that the corresponding **Requested Item** is created.

2. Requested Item Verification

After submission, the generated **Requested Item** is verified.

The Standard Laptop Catalog Item and submitted request information are checked to ensure that the request has been recorded correctly and is available for further processing.

This confirms that the request reaches the approval stage correctly.

3. Approval Process Verification

The Standard Laptop request is processed through the configured approval process.

The approval status is checked to verify that the request receives the required **Approved** status. The approved request is then allowed to proceed to the automated processing stage.

This verifies that task creation occurs only after the required approval.

4. Flow Designer Automation Verification

The **Standard Laptop Task** flow is verified to ensure that it is associated correctly with the Standard Laptop request and executes after the required approval.

The flow execution is checked to confirm that the configured **Create Catalog Task** action is executed successfully.

5. Automatic Catalog Task Creation

Following successful Flow Designer execution, the system is checked to verify that a **Catalog Task** is created automatically for the approved Standard Laptop request.

The generated task is verified to ensure that it is associated with the correct **Requested Item** and contains the configured task information.

6. Catalog Task Assignment Verification

The assignment of the automatically created Catalog Task is verified.

The **Assignment Group** field is checked to confirm that the task is assigned to the **Hardware** group.

This verifies that the configured automation eliminates the need for separate manual assignment of the task.

7. Catalog Task Details Verification

The created Catalog Task is reviewed to verify the required details configured in the flow.

The following information is checked:

Field	Expected Verification
Requested Item	Correct Standard Laptop Requested Item
Short Description	Laptop need to be Configured
Description	Configured laptop configuration description
Assignment Group	Hardware
Task Status	Task created successfully

This confirms that the Catalog Task contains the required information for the Hardware team to process the request.

8. End-to-End Workflow Verification

The complete workflow is verified as a single process, beginning with the Standard Laptop request and continuing through approval, Flow Designer execution, Catalog Task creation, and Hardware assignment.

The complete workflow is:

Standard Laptop Catalog Item

↓

Request Submission

↓

Requested Item

↓

Approval

↓

Approved

↓

Standard Laptop Task Flow

↓

Catalog Task Created

↓

Assigned to Hardware

This verifies that the different stages of the solution work together correctly and that the required information is carried from the request through the automated task-creation process.

9. Error Identification and Re-verification

During the testing process, the configured request, approval, flow execution, task creation, and assignment are checked for any configuration or execution issues.

If an issue is identified, the relevant ServiceNow or Flow Designer configuration is reviewed and corrected, after which the affected process is verified again.

Testing Outcome

The testing confirms that the **Standard Laptop Procurement Automation** workflow functions as intended in ServiceNow.

The verification confirms that:

- The Standard Laptop request can be submitted successfully.
- The Requested Item is created correctly.
- The approval process is completed before automated task processing.
- The **Standard Laptop Task** Flow Designer flow executes correctly.
- A Catalog Task is created automatically after approval.
- The Catalog Task contains the required information.
- The task is automatically assigned to the **Hardware** Assignment Group.
- The complete workflow operates from request submission through task assignment.

Result: The Standard Laptop procurement workflow was successfully tested and verified.

Status: PASS
