

PROJECT DEVELOPMENT - PHASE 5

MODULE 1 : User Acceptance Testing Report

Date :	27.09.2026
Team ID :	SWTID-2026-4107
Project Name :	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

USER ACCEPTANCE

5.1 Introduction

User Acceptance is carried out to verify whether the developed **Standard Laptop Procurement Automation** meets the defined user and process requirements.

In this project, User Acceptance focuses on verifying whether a user can submit a Standard Laptop request through ServiceNow and whether the request proceeds correctly through approval, automated task creation, and assignment to the Hardware team.

The acceptance process therefore checks the workflow from the user's request through the point where the required Catalog Task is automatically created and assigned.

5.2 Objective of User Acceptance

The main objective of User Acceptance is to verify that the developed Standard Laptop procurement workflow satisfies the defined requirements.

The objectives are:

1. To verify that the Standard Laptop request can be submitted successfully.
2. To ensure that the Requested Item is created correctly.
3. To verify that the approval process works as configured.
4. To confirm that the **Standard Laptop Task** Flow Designer flow executes after approval.
5. To verify automatic Catalog Task creation.
6. To confirm that the created task is assigned to the **Hardware** Assignment Group.
7. To verify that the required task information is available for Hardware processing.
8. To confirm that the complete workflow operates with reduced manual intervention.

5.3 User Acceptance Process

The User Acceptance process begins with submitting a Standard Laptop request through the ServiceNow Service Catalog.

The submitted request is checked to ensure that the Requested Item is created correctly. The request is then processed through the configured approval process.

After the request receives the required approval, the **Standard Laptop Task** Flow Designer flow is expected to execute automatically. The system is then checked to verify that a Catalog Task is created and assigned to the Hardware Assignment Group.

The complete process is reviewed to confirm that the developed solution meets the expected user and process requirements.

This follows the reference's acceptance-process approach, but removes things your project doesn't actually contain, such as notifications.

5.4 User Acceptance Activities

Request Submission:

The Standard Laptop request is submitted through the ServiceNow Service Catalog.

Request Verification:

The generated Requested Item is checked to ensure that the request details are captured correctly.

Approval Verification:

The request is processed through the configured approval process and the approval status is verified.

Workflow Verification:

The Standard Laptop Task Flow Designer flow is checked to ensure that it executes after the required approval.

Task Verification:

The system is checked to confirm that a Catalog Task is automatically created.

Task Assignment Verification:

The created Catalog Task is checked to confirm that it is assigned to the Hardware Assignment Group.

Task Detail Verification:

The Catalog Task details are reviewed to ensure that the required Requested Item, description and assignment information are available.

5.5 User Acceptance Criteria

The project is considered acceptable when the following conditions are satisfied:

- The Standard Laptop request can be submitted successfully.
- The Requested Item is created correctly.
- The approval process is completed as configured.
- The Flow Designer flow executes correctly after approval.
- The Catalog Task is created automatically.
- The task is assigned to the Hardware Assignment Group.
- The required task information is available.
- The complete workflow operates without unnecessary manual task creation or assignment.

5.1.6 Expected Outcome

The expected outcome of User Acceptance is a Standard Laptop procurement workflow that satisfies the defined requirements.

The user should be able to submit a Standard Laptop request, while ServiceNow and Flow Designer handle the configured approval-dependent task creation and Hardware assignment automatically.
